

A hand towards your future

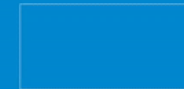

Tissue-Tek SmartConnect®
Automated Transfer System

continuous innovation for pathology

Empowerment through automation

An essential step in histopathology today is the transformation towards automation. By automating the steps in the histopathology laboratory, we can ensure a more optimal flow, and safeguard high-quality output for the best results.

**Is your lab ready
for tomorrow?**

Meet SARA

Smart Autonomous Robotic Assistant

A helping hand in your laboratory

With an increasing rise in the number of cancer cases, we see laboratories working as hard as they can to deal with cases in the limited time they have. That's why we believe they can use all the help they can get so they can work on what truly matters.

With SARA you will

Optimise the workflow

by providing an automated continuous flow from processing till embedding without any interruption. Standardising the process.

Have better control

handling cases without the need for human interaction and with the track & trace possibility we make sure that the lab always knows what the status of tissue samples is within processing and embedding. The possibility to prioritise cases enables to control the workflow for those urgent cases that need it.

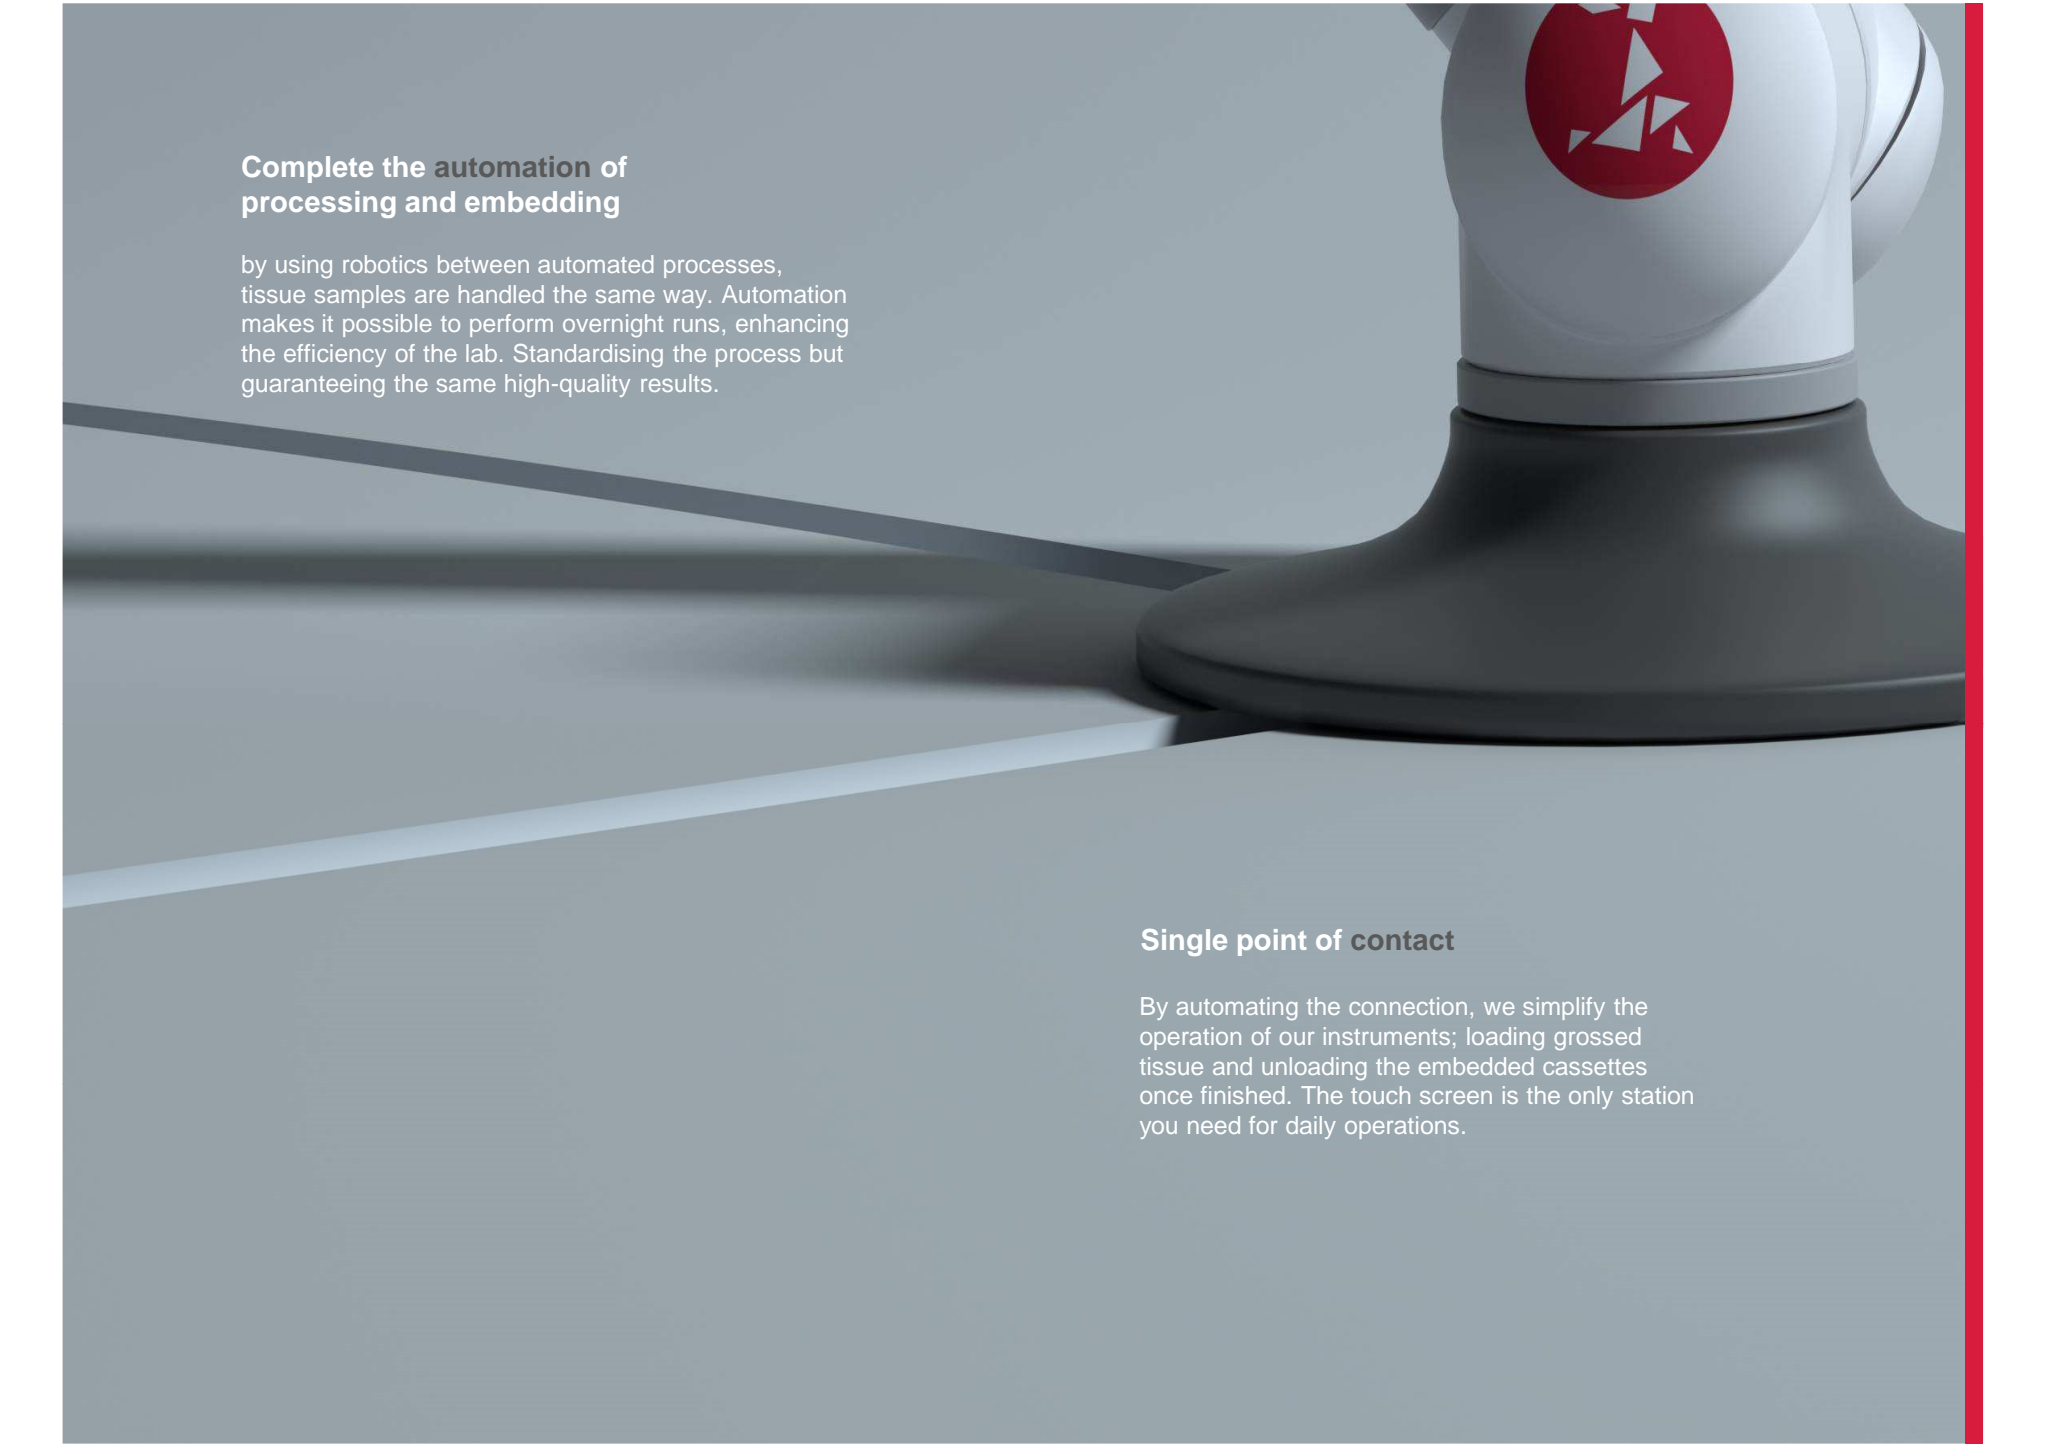

Contribute to eliminating unnecessary repetitive work

offering a helping hand to laboratories, empower them to focus on important cases and improve overall turn-around-times whilst handling the increasing workload.

Enable track and trace

in processing and embedding can enhance the efficiency of a laboratory and has a positive effect on patient safety because it helps trying to find a missing block or cassette.

Complete the automation of processing and embedding

by using robotics between automated processes, tissue samples are handled the same way. Automation makes it possible to perform overnight runs, enhancing the efficiency of the lab. Standardising the process but guaranteeing the same high-quality results.

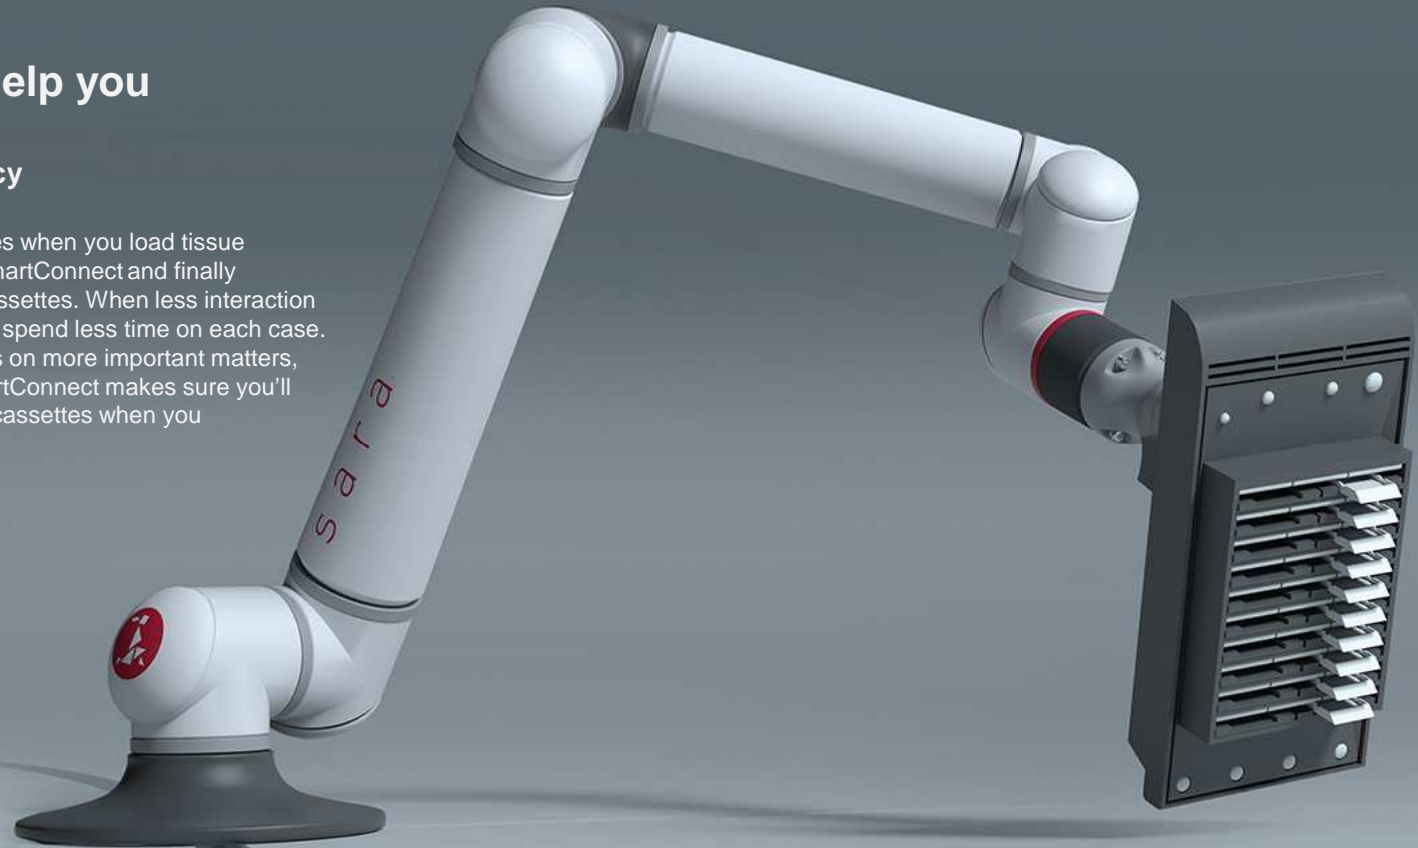

Single point of contact

By automating the connection, we simplify the operation of our instruments; loading grossed tissue and unloading the embedded cassettes once finished. The touch screen is the only station you need for daily operations.

SARA can help you

Increase efficiency

Imagine the possibilities when you load tissue into the Tissue-Tek SmartConnect and finally take out embedded cassettes. When less interaction is needed, technicians spend less time on each case. Enabling them to focus on more important matters, while Tissue-Tek SmartConnect makes sure you'll have your embedded cassettes when you need them.
